DETAILED ACTION

Election/Restrictions

1. Applicant's election of Group I, claims 1-13, in the reply filed on 8-15-05 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).
2. Claims 14-17 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected invention, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on 8-15-05.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Matsui (6,331,371) in view of Itoh (5,031,623) and Takesue (5,721,082). Matsui teaches a multi-layered electrophotographic organic photoconductor that contains a conductive substrate, charge transport layer, and charge generating layer. Matsui teaches that the charge transport contains a stilbene and is applied by using tetrahydrofuran as a solvent (col. 8 line 54 – col. 9 line 21). Matsui also teaches that the charge generating layer is applied by using a combination of an alcohol and an acetate solvent (col. 8 lines 42-49). Matsui does not teach the specific charge transport and

charge generating materials. Itoh (col. 24) teaches the specific stilbene charge transport materials applied with tetrahydrofuran solvent and Takesue (col. 17) teaches the specific amine charge generating material in similar multi-layered electrophotographic organic photoconductor applications. It would have been obvious to one of ordinary skill in the art to substitute well known charge generating and transport materials taught by each of Itoh and Takesue in the multi-layered electrophotographic organic photoconductor taught by Matsui because of the well known effects of such materials with the expectation of similar results used for the same intended purposes to arrive at the multi-layered electrophotographic organic photoconductor produced by known solvents.
